## CHAPTER I.

### PRELIMINARY PROBLEMS.

	PAGE
Art. 1.	7
<i>Of the Prismoid.</i> —Origin probably ancient. Prismoidal Rule, first devised and demonstrated by THOMAS SIMPSON (1750). Generalized and improved by CHARLES HUTTON (1770). Now known as the <i>Prismoidal Formula</i> . A Prismoid defined, described, and illustrated by Fig. 1. The Prismoid, a frustum of a wedge, which latter is itself a truncated triangular Prism. Example of rectangular Prismoids, by Simpson's Rule and other processes.	8
Art. 2.	10
<i>Simpson's Prismoidal Rule.</i> Applicable chiefly to rectangular and triangular Prismoids, with examples of each. Illustrated by Fig. 2.	11
Art. 3.	12
<i>Hutton's Prismoidal Rules.</i> —His definition of a Prismoid. <i>General Rule</i> , in which the hypothetical mid-section, deduced from the ends, is first introduced by him, thus generalizing the rule, and materially extending its usefulness. Particular Rule, deduced from the wedge. Rectangular Prismoid, composed of two wedges. Initial Prismoids, to determine generality of rule. Applicability of Hutton's Rule to various solids, named by him. Example of computation by General and Particular rules; also, by Initial Prismoids. The T Prismoid, example of its computation. Figs. 3, 4, and 5 illustrate this article.	13
	15
	16
Art. 4.	18
<i>The Prismoid adapted to Earthwork.</i> —By Sir John Macneill, C. E. (Fig. 6), his figure of a prismoid composed of a prism and superposed wedge. Demonstrates the Prismoidal Rule, and uses it in an extensive series of Tables (1833).	19
Art. 5.	20
<i>The Prismoid in its Simplest Form.</i> —Computed by several rules. Illustrated by Fig. 7.	21
Art. 6.	21
<i>Further Illustration of Macneill's Prismoid.</i> —Double cross-sectioned in Fig. 8. Concise rule for earthwork wedges, confirmed by Chauvenet's Geometry. Brevity of computation of earthwork solids on level ground, by combining the rules for Wedge and Prism. Wedges applicable also to irregular ground.	22
Art. 7.	24
<i>Trapezoidal Prismoid of Earthwork, considered as two Wedges.</i> —Hutton's Particular Rule, modified for earthwork. Illustrated by Fig. 9, and by examples.	25
Art. 8.	26
<i>Areas of Railroad Cross-sections (within Dihedral Angles), whether Triangular, Quadrangular, or Irregular.</i> —Triangles and Trapeziums computable by their heights and widths, taken rectangularly, however they may be placed (see Figs. 10, 11, 12, and 13). Exact method of equalizing irregular ground surface, by a single right line (see Figs. 14 and 15). Calculation of areas of cross-sections (Figs. 16 and 17). Very irregular cross-sections require division into elementary figures, these to be separately computed and totalized.	28
	29
	30
	32
	33
	34
	35
Art. 9.	36
<i>Further Illustration of the Modification of Simpson's Rule, etc.</i> —Example illustrated by Fig. 18. Diagram of Simpson's mid-section, Fig. 19, showing its curious composition. Diagram of the formulas of Simpson and Hutton, Fig. 19½. Formula deduced from it.	37
Art. 10.	40
<i>Adaptation of the Prismoidal Formula to Quadrature, Cubature, etc., by Simpson and Hutton.</i> —Explanation of it by Hutton, under the head of Equidistant Ordinates, Fig. 20. Example of two stations of earthwork, Figs. 21 to 25. Coincidence with the Prismoidal Formula. Earthwork calculations by Roots and Squares, explained and illustrated by examples, and by Figs. from 27 to 35; also, by comparison with other methods. Computation of the passages at grade points, from excavation to embankment, Figs. 36 to 42.	42
	44
	46
	47
	53
Art. 11.	55
<i>Cross-sections in Dihedral Angles, to find Mid-section, etc.</i> —Illustrated by Figs. 43 and 44.	56
Art. 12.	59
<i>To find Prismoidal Mean Area, from Arithmetical or Geometrical Means, from the Mid-section, or by Corrective Fractions.</i> —Examples, illustrated by Figs. 45 and 46.	60
Art. 13.	62
<i>Applicability of the Prismoidal Formula to other Solids.</i> —The three round bodies computable by it. Examples given and illustrated by Fig. 47. This formula also applies to the three square, or angular bodies.	62

CHAPTER III.

SECOND METHOD OF COMPUTATION, BY HEIGHTS AND WIDTHS, AFTER SIMPSON'S ORIGINAL RULE.

Art. 20.	98
Art. 21.	101
Art. 22.	104

CHAPTER IV.

THIRD METHOD OF COMPUTATION, BY MEANS OF ROOTS AND SQUARES; A PECULIAR MODIFICATION OF THE PRISMOIDAL FORMULA, WHICH WILL BE FOUND IN PRACTICE TO BE BOTH EXPEDITIOUS AND CORRECT, IN ORDINARY CASES.

Art. 23.	108
Art. 24.	110
Art. 25.	114

CHAPTER V.

FOURTH METHOD OF COMPUTATION, BY REGARDING THE PRISMOID AS BEING COMPOSED OF A PRISM, WITH A WEDGE SUPERPOSED, OR OF A WEDGE AND PRISM COMBINED.

Art. 26.	118
Art. 27.	122
	123
Art. 28.	127
Art. 29.	131

		PAGE
Art. 30.	The Rhomboidal Wedge and Pyramid introduced. Examples of calculation by using them to find the solidity of a prismoid.	133
	The method of using the Rhomboidal Wedge and Pyramid combined. (Figs. 81 and 82.)	135
	Any irregular earthwork, within certain limits, computable by Wedge and Pyramid. Process of computation. Notation of rule. The Rule itself. Its limits of range.	137
	Examples of computation by Wedge and Pyramid; direct and reverse. Re-computing by this method the examples of Chapter II., and showing their near coincidence. Illustrated by Figs. from 53 to 64, in Chapter II.	139
	Example of heavy embankment (from Warner's Earthwork), computed by Wedge and Pyramid.	142
	Peculiar solid again; illustrating Case 2, of the rule for Wedge and Pyramid, which correctly gives its volume.	143
<b>CHAPTER VI.</b>		
PROFESSOR GILLESPIE'S FOUR USUAL RULES, WITH THEIR CORRECTIONS, AND A COMPARISON OF HIS CHIEF EXAMPLE WITH OUR THIRD METHOD OF COMPUTATION—BY ROOTS AND SQUARES.		
Art. 31.	The late Professor Gillespie's ability and labors. The four usual rules, which he found in use. 1. Arithmetical Average, a rule very much used, but very incorrect. The correction necessary for true results. Tabulation of an example by the Arithmetical Average, with Gillespie's correction. 2. Middle Areas, rule explained and formula for correction to give true solidity. Tabulation of example by Middle Areas, with correction. 3. The Prismoidal Formula, as generalized by Hutton. The <i>test rule for all</i> . Tabulation of example by it. 4. Mean Proportionals, or Geometrical Average. Explanation of the rule. Gillespie's condemnation of Geometrical Average, and of Equivalent Level Heights, evidently hasty.	145
Art. 32.	Re-computation of example by Geometrical Average, using the grade triangle, and tabulating to intersection of side-slopes. Solidity the same as given by the Prismoidal Formula, as calculated by Gillespie himself. Generalization from which this rule flows. Equivalent Level Heights. Tabulation of an example by them to intersection of side-slopes. Resulting in solidity the same as by the Prismoidal Formula, calculated by Professor Gillespie.	151
Art. 33.	Five reliable rules for earthworks, deduced from this Chapter. Brief reference to the Core and Slope Method, one of the earliest proposed, and often re-produced, but not in general use.	152
Art. 34.	Tabulated comparison of Gillespie's example by the method of Roots and Squares, agreeing with the Prismoidal Formula, and may be used with Simpson's Multipliers. Gillespie's examples usually refer to level ground, and hence are easily computed.	154
<b>CHAPTER VII.</b>		
PRELIMINARY OR HASTY ESTIMATES, COMPUTED BY SIMPSON'S RULE FOR CURATURE.		
Art. 35.	Nature of Preliminary Estimates. Rough and expeditious, but giving quantities proximately correct. Quantities to be always full, but never excessive. Simpson's rule for curature. Explanation and notation. Mode of numbering the cross-sections, even and odd. Cuts and Banks to be computed separately, each in a body. General Mean Area to be found, and multiplied by length for volume.	156
Art. 36.	Simpson's Multipliers, their convenience and application. Diagrams indicating a probable construction of the rule for curature, and its intimate connection with the Prismoidal Formula (Figs. 77 and 78.)	158
Art. 37.	Rough profile to be sketched, involving heights and ground slopes. Computation of a Bank by Simpson's Multipliers. Rock-cut calculated in the same way. Both illustrated by Fig. 76.	160
Art. 38.	Reference to the grade prism. Earth cutting, Fig. 29, computed by both Roots and Squares and the Hasty Process, differing only one and a half per cent.	163
	Tables (four in number) for use in Preliminary or Hasty Estimates.	166
—		
	Following this Chapter, and closing the Book, will be found an extensive TABLE OF CUBIC YARDS to mean areas for 100 feet stations ( <i>entirely clear of error</i> , it is believed), giving the Cubic Yards for every foot and tenth of mean area from 0 to 1000, by <i>direct inspection</i> . And being computed accurately to three decimal places, ranges correctly up to 100,000 square feet of mean area, or to a cut 1000 feet wide, and 100 feet deep. Table preceded by explanations, and some examples of its use. This Table also operates as a general one for the conversion of <i>any</i> saws of cubic feet into Cubic Yards, by simply dividing by 100 and using the quotient as a mean area.	173

EASY RULES  
FOR THE  
MEASUREMENT OF EARTHWORKS,  
BY MEANS OF THE PRISMOIDAL FORMULA.

---

CHAPTER I.

PRELIMINARY PROBLEMS.

1. *Of the Prismoid.*—Although this solid probably originated with the ancient geometers—THOMAS SIMPSON (1750), an eminent mathematician of the last century, appears to have been *the first*, in later days, to demonstrate the rule for its solidity,\* now accepted by modern mensurators; and he was soon followed by Hutton, in his quarto treatise on Mensuration,† who by another process again demonstrated the Prismoidal Rule, and at the same time laid the foundations of modern mensuration, in a manner so solid, that it has come down to our time, through various editors and commentators, *substantially* (in many cases literally) *the same* as established by Hutton in his famous work of 1770.

Simpson's rule for the prismoid has been variously transformed, and written, and is now generally known by the name of *the prismoidal formula*, of which we will give hereafter the usual expressions, as well as some useful modifications, the same in substance, but often more convenient for practical purposes.

The solid called a Prismoid (from its general resemblance to a prism, and in like manner named from its base, triangular, rectangular, trapezoidal, etc.) *is a body contained between two parallel planes,*
