CHEMICAL FERTILIZERS AND PARASITICIDES

CHEMICAL FERTILIZERS AND PARASITICIDES

BY

S. HOARE COLLINS, M.Sc., F.I.C.

LECTURER AND ADVISER IN ACRICULTURAL CHEMISTRY, ARMSTRONG COLLEGE, REWCASTLE-ON-TYNE (UNIVERSITY OF DURHAM) FORMERLY ASSISTANT ACRICULTURAL CHEMIST TO THE GOVERNMENT OF INDIA: AUTHOR OF "HAND-BOOK OF ACRICULTURAL CHEMISTRY FOR INDIA: STUDENTS" AND "PLANT PRODUCTS"

NEW YORK D. VAN NOSTRAND COMPANY 25 PARK PLACE

1920

GENERAL PREFACE

THE rapid development of Applied Chemistry in recent years has brought about a revolution in all branches of technology. This growth has been accelerated during the war, and the British Empire has now an opportunity of increasing its industrial output by the application of this knowledge to the raw materials available in the different parts of the world. The subject in this series of handbooks will be treated from the chemical rather than the engineering standpoint. The industrial aspect will also be more prominent than that of the laboratory. Each volume will be complete in itself, and will give a general survey of the industry, showing how chemical principles have been applied and have affected manufacture. The influence of new inventions on the development of the industry will be shown, as also the effect of industrial requirements in stimulating invention. Historical notes will be a feature in dealing with the different branches of the subject, but they will be kept within moderate limits. Present tendencies and possible future developments will have attention, and some space will be devoted to a comparison of industrial methods and progress in the chief producing countries. There will be a general bibliography, and also a select bibliography to follow each section. Statistical information will only be introduced in so far as it serves to illustrate the line of argument.

Each book will be divided into sections instead of chapters, and the sections will deal with separate branches of the subject in the manner of a special article or monograph. An attempt will, in fact, be made to get away from the orthodox textbook manner, not only to make the treatment original, but also to appeal to the very large class of readers already possessing good textbooks, of which there are quite sufficient. The books should also be found useful by men of affairs having no special technical knowledge, but who may require from time to time to refer to technical matters in a book of moderate compass, with references to

the large standard works for fuller details on special points if required.

To the advanced student the books should be especially valuable. His mind is often crammed with the hard facts and details of his subject which crowd out the power of realizing the industry as a whole. These books are intended to remedy such a state of affairs. While recapitulating the essential basic facts, they will aim at presenting the reality of the living industry. It has long been a drawback of our technical education that the college graduate, on commencing his industrial career, is positively handicapped by his academic knowledge because of his lack of information on current industrial conditions. A book giving a comprehensive survey of the industry can be of very material assistance to the student as an adjunct to his ordinary textbooks, and this is one of the chief objects of the present series. Those actually engaged in the industry who have specialized in rather narrow limits will probably find these books more readable than the larger textbooks when they wish to refresh their memories in regard to branches of the subject with which they are not immediately concerned.

The volume will also serve as a guide to the standard literature of the subject, and prove of value to the consultant, so that, having obtained a comprehensive view of the whole industry, he can go at once to the proper authorities for more elaborate information on special points, and thus save a couple of days spent in hunting through the libraries of scientific societies.

As far as this country is concerned, it is believed that the general scheme of this series of handbooks is unique, and it is confidently hoped that it will supply mental munitions for the coming industrial war. I have been fortunate in securing writers for the different volumes who are specially connected with the several departments of Industrial Chemistry, and trust that the whole series will contribute to the further development of applied chemistry throughout the Empire.

SAMUEL RIDEAL.

PREFACE

In the companion volume in this series, entitled "Plant Products," the chemical fertilizers are only treated from the point of view of crop increment; in the following pages it is rather the sources and modes of manufacture of the chemical fertilizers that take precedence. Nevertheless, no trader can afford to ignore the aims of the purchasers of the commodity he sells or leave out of account the ultimate ends which his manufactures may fulfil. For this reason some slight indication is given of the various purposes to which the chemical fertilizers are applied, and some suggestions are made on the better utilization of the materials at our disposal for improving the produce of land.

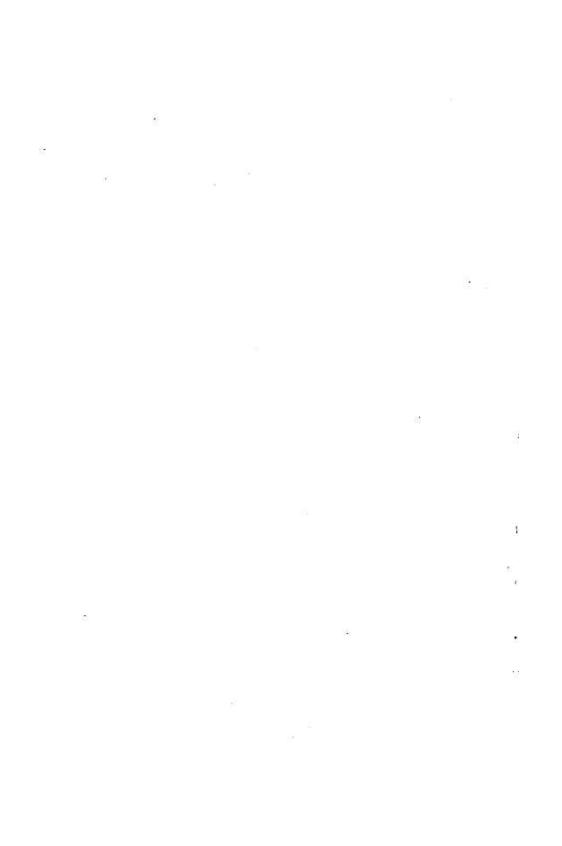

The last part of the volume describes some poisons used to combat destructive insects and injurious parasites.

As in the other volumes of the series, references are made at the end of each section for consultation on matter alluded to in the preceding text, whilst a General Bibliography concludes the volume with a list of general works giving information beyond the limits set for the survey in this book.

I have to thank Dr. A. A. Hall, Dr. G. C. Arnott, and Mr. A. Spiller for much assistance in reading the proofs.

S. HOARE COLLINS.

February, 1920.
