## PREFACE TO THE REVISED EDITION OF 1866.

---

THE revision of Professor Olmsted's *Astronomy* made in 1861, owing to circumstances which I could not well control, was not so thorough as I desired. The present edition is more in accordance with the idea which was in my mind, but which was then only partially carried out. The changes now introduced are principally of the same nature as those made in the revision of the *College Natural Philosophy*. Some historical matter is omitted; a few alterations are made in the arrangement of topics; the subject of nearly every paragraph is presented in an italic heading; and, throughout, I have aimed to state principles and describe phenomena with more conciseness, where I thought I could do it with equal clearness. About one-half of the engravings are new. A part of these are for the illustration of points either not illustrated or not discussed before, and a part are substituted for those which were faulty. The true proportions of lines and angles can not, in general, be presented in astronomical diagrams; and the pupil must depend mainly on his teacher for the help which he needs in this respect. In a very few cases, where it seemed practicable, a figure is added, simply for the purpose of exhibiting the true size of an angle, and the correct proportion of lines. A few pages at the end of the volume are occupied with tables, which may be found useful.

I am much indebted to Professor Henry H. White, of the Kentucky University, who has very kindly aided me by numerous criticisms and suggestions, of which I have made free use in this revision.

E. S. SNELL.

AMHERST COLLEGE, March, 1866.

AMHERST COLLEGE

# CONTENTS.

## CHAPTER I.

	PAGE
Astronomy.—Its subject.—Globular form of the earth proved.—Modes of measuring the earth.—The terrestrial equator.—The horizon and secondaries.—The celestial equator.—The ecliptic.—The diurnal motion.—Its phenomena.—Problems on the globes.....	1-14

## CHAPTER II.

Parallax.—Diurnal parallax.—Its variation.—To find the parallax of the moon.—Atmospheric refraction.—Illumination of the sky.—Twilight.....	15-23
---	-------

## CHAPTER III.

The observatory.—The transit-instrument.—The astronomical clock.—Measuring right ascension.—The mural circle.—Measuring declination.—Altitudes and azimuth instruments.—The sextant.—Spherical problems.....	24-38
--	-------

## CHAPTER IV.

Observations of the sun's place.—The ecliptic and zodiac.—The annual motion.—The change of seasons.—Arrangement of heat and cold.—Form of the earth's orbit.—Mode of determining it.....	39-47
--	-------

## CHAPTER V.

The sidereal and solar day.—Mean and apparent solar time.—Reasons why solar days are unequal.—The equation of time.—The calendar.....	47-54
---	-------

## CHAPTER VI.

Projectile, centripetal, and centrifugal forces.—Laws of centrifugal force.—Its effects on the earth.—Loss of weight.—Spheroidal form.—Proofs of diurnal motion.....	54-62
--	-------

## CHAPTER VII.

The sun.—Its form.—Its distance.—Its dimensions.—Its rotation.—Solar spots.—Theory of spots.—Condition of the sun's surface.—The zodiacal light.....	62-69
--	-------

CONTENTS.

v

CHAPTER VIII.

Kepler's laws.—Law of areas proved.—Law of gravity proved.—Its prevalence throughout the system.—The paths of projectiles.—Effect of an impulse on one body of a system.....	PAGE 69-80
--	---------------

CHAPTER IX.

Precession of equinoxes.—Consequent motion of the poles.—Cause.—Composition of rotations.—The tropical and sidereal years.—Nutation.—Aberation of light.—Velocity of light discovered.—Advance of apsidæ.—Its cause.—How to find the sun's true place.....	80-88
--	-------

CHAPTER X.

The moon.—Its distance and size.—Its motion round the earth.—Its orbit.—Librations.—Its path about the sun.—Its phases.—The harvest moon.—The moon's surface.—Measurement of its mountains.—Appearance of the earth from the moon.....	88-102
--	--------

CHAPTER XI.

The moon's motion disturbed by the sun.—Gravity to the earth diminished.—Equations for finding the moon's place.—Equation of the center.—Evection.—Variation.—Annual equation.—Advance of apsidæ.—Retrogradation of nodes.—Periodical and secular equations.....	102-109
--	---------

CHAPTER XII.

Eclipses.—Their cause.—Eclipse months.—The earth's shadow.—Its dimensions computed.—To find beginning, middle, and end of a lunar eclipse.—Eclipse of the sun.—Dimensions of the moon's shadow.—Its velocity over the earth.—The Saros.—Phenomena of a solar eclipse.....	109-124
---	---------

CHAPTER XIII.

Methods of determining longitude.—By the chronometer.—By eclipses.—By the lunar method.—By the telegraph.—Change of days in going round the earth.....	125-129
--	---------

CHAPTER XIV.

Tides.—Form of equilibrium under the action of the moon.—Joint action of sun and moon.—Diurnal inequalities.—Effect of coasts.—Tides in seas and lakes.....	130-135
---	---------

CHAPTER XV.

Planets grouped.—Distances from the sun.—Revolutions.—Dimensions.—Masses and densities.—Mercury.—Its motions.—Its phases.—Its transits.—Venus.—Its transits.—Parallax of the sun found.—Mars.—Its motions....	135-151
---	---------

## CHAPTER XVI.

	PAGE
The planetoids.—Jupiter.—Its belts.—Its satellites.—Their eclipses and occultations.—The velocity of light found by them.—Saturn.—Its rings.—Their disappearances.—The satellites of Saturn.—Uranus.—Its satellites. Neptune.—Its discovery.....	153-164

## CHAPTER XVII.

Elements of a planetary orbit.—Method of finding the first.—The second.—The third.—The fourth.—The fifth and sixth.—The masses of the planets found.—Perturbations.—In the positions of orbits.—In their forms.—Stability of the system.—Relations of the planets.....	165-180
--	---------

## CHAPTER XVIII.

Comets.—Their number.—Effects of eccentricity of orbit.—Dimensions of comets.—Their masses.—How to find their orbits.—Halley's comet.—Comets of short period.—A resisting medium.—Remarkable comets.—Shooting stars.—Meteoritic showers.—Aerolites.....	180-194
---	---------

## CHAPTER XIX.

The stellar universes.—Classifications of stars.—Constellations.—Annual parallax.—Stars whose distance is known.—Nature of fixed stars.—Proper motions.—Double stars.—Binary stars.—Their orbits.—Their masses.—Periodic stars.—Clusters.—Nebulae.—The galaxy.—The Nebular hypothesis.....	194-218
--	---------

ASTRONOMICAL TABLES.....	214-219
--------------------------	---------
