P R E F A C E.

THE following work is now submitted to my professional brethren as a contribution to the clinical surgery of the diseases and injuries of the joints.

It is not to be regarded as a complete treatise upon these important and interesting subjects, but simply as the record of much personal investigation, and of some experience.

The consideration of the diseases of the joints has been based upon pathological inquiries, which have extended over a period of some years; and the injuries of the joints are illustrated by cases which have, with but few exceptions, passed under my own observation.

The labours of my predecessors have not been disregarded; and if their names have been left unmentioned, it is not from the want of a due appreciation of their merits, but from the idea that

the record of personal experience is generally the most valued, and that by the adoption of another course these pages would have been indefinitely extended.

A portion of the material here printed has been already published in the periodicals of the day ; but it is hoped that the interest of the whole has not been thereby diminished, and that the intentions of the author may not prove unsuccessful.

To the student and practitioner it is believed that this work will be of value as a guide to their clinical practice, and the shortcomings of the present volume will probably be corrected at some future period.
