OPINIONS OF THE PRESS.

FIRST EDITION.

"We hope to see Mr. Anderson's next work devoted to all the forms of cutaneous diseases, which could be no difficulty with him, judging from this interesting monograph on the parasitic affections."-Dublin Medical Press.

"A very useful practical monograph. . . . We think all readers interested in its subject will be pleased."-The American Journal of the Medical Sciences.

"His descriptions of disease are clear; his illustrations, some of them original, are very good; his treatment judicious, founded, as we have said, on observation abroad and practice at home; and on the whole we can heartily recommend this work."—British Medical Journal.

"Gratifying to the reader in every respect. Scientific earnestness and elearness and simplicity of description are qualities which have doubtless already won, and will yet win, for it many friends."-Vienna Medical Journal.

"The production of a practical physician, who, having detected a want in the literature of his profession in this country, and consequently in the presumable knowledge of his countrymen, has recorded for their benefit his own judgments, which have been formed in a wide field, with great opportunities for observation, and great good sense in taking advantage of them."-Giaegous Medical Journal.

"It savours of a desire to found the pathology and treatment of cutaneous diseases on a true base, and thus contrasts very favourably with many books which have issued from the press of late years on the same subject."—Dublia Quarterly Journal.

"Dr. Anderson's position as Physician to the Dispensary for Skin Diseases, Glasgow, has given him unusual facilities for studying the affections to which he here directs attention, and we are bound to say that he has turned his advantages to the best account. . . There are many facts in this book which are of interest to the public, not less than to the profession; for although it is essentially written for medical men, it is so plain that any educated man may read it with profit."—Social Science Review.

OPINIONS OF THE PRESS.

"We cordially recommend this book to practical men, to whom it will doubtless prove most useful; and we hope next year to have the pleasure of reviewing a *fourth* monograph of Dr. M'Call Anderson."—Dublin Quarterly Journal of Medical Science.

"From the first Dr. Anderson has been a staunch supporter of a classification of skin diseases hased, as much as possible, upon their nature and causes. A pupil of Bazin and of Hebrs, he brought to this country views which were at first distasteful to bis medical brethren, but which have since been very generally accepted. He was the first in this country to show that herpes tonsurans, herpes circinatus, and sycosis parasities are all varieties of one disease, due to the presence of one parasite—the tricophyton. His classification of enzema, which was published in the second number of his "Contributions to Dermatology," is more perfect than that of Hebra, in that it includes the *Eczema reinosma* (Eczema fendillé of the French), and it has been accepted by the highest authorities. It was, therefore, with pseuliar interest that we opened the pages of Dr. Anderson's third volume; nor have we been disappointed.

"This book before us is an exhaustive little volume, carefully written, and simply expressing the results of experience. It is invaluable both to the practitioner and to the student."-Medical Times and Gaussite.

"The present volume is, like Dr. Anderson's other Contributions to Dermatology, a work of high practical value."-British Medical Journal.

"We heartily recommend the work to the notice of the profession, and congratulate Dr. Anderson on having produced a third valuable contribution on a subject which has hitherto been too little studied in this country."—Ediabaryh Medical Journal.

"These are the most recent contributions to his favourite study of a physician whose name in connection with dermatology is already widely known and deservedly respected. They are calculated to extend and strengthen his reputation."—Glasgow Medical Journal.

"This is the third of Dr. Anderson's valuable contributions to demnatology. It is an able treatise on two forms of skin disease, which often tax the skill of the practitioner to the utmost."-The Half-Yearly Abstract of the Medical Sciences.

OPINIONS OF THE PRESS.

FIRST EDITION.

"No one will dispute that, from the perusal of the author's treatise, instruction may be gained relative to the management of a very troublesome affection of the cutaneous surface." -Lancet.

" Dr. Anderson extends the term (Eczems) to a number of forms of disease which have got other names ; and we are inclined to think he is right. . . . The book is one which will be read with interest by those who like to know what an intelligent practitioner thinks of a very common form of skin disease."-Athenerum,

" Its author speaks to us after an extended experience and much close observation. The first few chapters are so excellent, so practical, and settle, in our opinion, so satisfactorily the true nature of Eczems, that we draw likerally from him; they are too good to be conitted.

"We have now had this little work under severe contribution, have extracted much useful information from it, many facts indeed with which we have not hitherto been acquainted; but they are but a small portion of all that are contained within its valuable pages, every one of which is replete with them."-Conada Loucet.

SECOND EDITION.

"Among the foremost contributors to dermstology in these countries, Hebra specially names Dr. M'Call Anderson of Glasgow; and having read the second edition of his book on Eczema, we gladly confess that Hebra's estimate is well founded, and we ball with pleasure an enlarged and much improved edition of his book on Eczema."-The Dublin Quarterly Journal of Medical Science.

"We are sure this book will, in due time, run to a third edition."-Medical Press and Circular.

" We had the pleasure of specially calling attention to the very practical character of the directions of Dr. M'Call Anderson for the treatment of this troublesome and common class of skin affections, as well as to his philosophic, clear views of dermatological arrangement. In this second edition the practical parts of the book have been extended, and it is still more worthy than its predecessor of the favour and attention of the profession."- British Medical Journal.

"We are glad to see that this excellent work has reached a second edition. The first edition we reviewed some years ago; and in the new we find that a considerable amount of additional matter, principally of a practical character, has been introduced. The former edition has been well received by the profession ; we confidently anticipate for the present one a similar or even increased popularity."-Edinburgh Medical Journal.

"This treatise upon Eczema should be in the hands of every one interested in this

important subject. "As regards those essential points to the busy practitioner, viz., diagnosis and treatment, is must prove invaluable."-Glasgow Medical Journal.

"From the able hands of a pupil of an able master. . We believe his book to be a valuable one, and one calculated to supply every wont that the student or the practi-

tionor might feel in the investigation of the disease with a view to its treatment. The test of the physician is his knowledge of the treatment of disease; and in his chapters devoted to the constitutional and to the local treatment of Eczema, we find our author completely at home, and armed at all points for any emergency that may unexpectedly arise. . . . We discover him to be a careful observer, an original thinker; and most projseworthy of all, to have always before him the great object of medicine, namely, the promotion of cure in the best and briefest manner."-Journal of Cutaneous Medicine.

PREFACE.

WITHIN the last few years the attention of scientific men has been specially directed towards the influence of fungi in the production of disease; but while a number of facts have been ascertained, which prove incontestably that they are capable of calling certain affections into being, the tendency unfortunately at the present time seems to be to overrate their importance, and to attribute to their action an immense variety of morbid states.

Their influence, however, in the production of certain skin diseases, which was very little heeded in this country when the first edition of this volume appeared, is now almost universally admitted, and every year finds us in possession of new facts which tend either to corroborate or to disprove previous theories.

For this reason it has been found necessary
