THIS work is composed of two parallel Biographies. The first comprises the Life and Labours of George Cuvier and Geoffrov (St. Hilaire), the men who have most contributed to the development of the true relation of Anatomy to the Science of Living Beings. In the second part the reader will find a brief history of the relation of Anatomy to the Fine In the parallel biographies of Leonardo, Arts. Angelo, and Raphael, the Author is convinced that ample materials exist for the decision of the long-protracted controversy in respect of the relation of Anatomy to the Arts of Sculpture and Design. He is at the same time well aware that long prior to the great men whose lives he has here sketched, others existed with minds equal if not superior to them, but who, from pursuing other studies and other aims than the political game of life, constitute, notwithstanding, an epoch or era, less

brilliant, less fiery, perhaps more durable, than the epochs of Cæsar, of Alexander, and Napoleon. Such was Aristotle, and such the men who carved the Venus, the Laocoon, and the Apollo. But of the lives of these latter, little or nothing is known : they left no writings explanatory of the Canons of Art: the works of the great masters in painting have disappeared, whilst the matchless sculptures alone remain to attest a power of mind and a civilization which we scarcely yet Although the Canons of Art comprehend. must have been well understood by them as their discoverers, yet it is certain, that, however admirably they appreciated the relation of Anatomy to Art, they had never studied Anatomy. To some this will appear a paradox : but if those who think so will favour me with a perusal of this work, they will, I hope, find the paradox solved. The true relation of Anatomy to Science was perfectly understood by Aristotle. Such at least was the opinion of Cuvier himself, the greatest anatomist ----Descriptive Anatomist-of any age. He preferred, as more exact, Aristotle's description of the anatomy of the elephant to that of Daubenton, his own immediate predecessor,

be it remarked; for Mertrud was nobody in Nevertheless, the author remains of science. the opinion, that prior to Bichat, exact Descriptive Anatomy, the greatest of all elements in the study of living beings, was unknown to Aristotle and to the world; whilst, in respect of philosophy, whatever the divine genius of the Greek may have grasped, a demonstration of his theory could not be given, so long as the anatomy of man and the human embryo was unknown to him. It remained then for Cuvier, Geoffroy, and Leonardo to test the true relation of Anatomy to Science, Philosophy and Art. The conjectures of the Ancients they converted into theories; they formed the era in which they lived. The object of this work then is threefold, 1st. To establish the exact relation of Descriptive Anatomy to the science of the animal organic world, as it now is and as it once existed. In the life and labours of George Cuvier, as he views them, the Author finds this relation fully made out. Before Cuvier appeared, geology was a farce, a subject of ridicule ; cosmogony a myth; the history of creation a tissue of error and absurdities. 2nd. To trace Transcendental Anatomy to its essence, and to

show, in the life and labours of Geoffroy (St. Hilaire), that the philosophy of the creation of animals is explicable only by Descriptive Anatomy. 3rd. To discover, if possible, in the life and labours of the immortal artist who painted the "Cena," and of his great rivals, Angelo and Raphael, the true relation of Descriptive Anatomy to Art.

Other matters are no doubt discussed in these scientific Biographies, for of such this work really consists. It were impossible, for example, to overlook the fact, that there are men whose lives form an epoch in man's history; whose lives form, in fact, the history of the period in which they live. Such was Newton in respect of science; such was Aristotle; and, politically, such were Cæsar, Alexander, and Napoleon; what these men were in respect of the brute masses of men, those I now speak of were to the thinking world. Yet they wielded but one element of knowledge— Anatomy — Descriptive Anatomy — a science not yet fully understood in Britain.

Throughout this work, by the term Science is meant a knowledge of the living organic world, man of course included, in relation to the existing circumambient media; its relation ADVERTISEMENT.

as it now appears to us, in time and in space, and the relation which each great natural section or grouping bears to all others. But in this definition the author ventures to include also the positive knowledge we have obtained through the discoveries of the immortal Cuvier, of the pre-existing organic forms, known by the name of Fossil Remains. The demonstrations of the relations of the groups of animals and plants comprising these organic worlds, apply equally, but less rigorously, than in the case of the now existing organic worlds, to these ante-historic organic configurations of life, owing to the destruction of nearly all the soft and perishable materials. The terms "former, or ancient world," "past creations," "successive organic worlds," are terms to which no definite meaning can be attached, there being in reality no such things. All these great results, as regards the progress of human knowledge, flow from the application of an element of thought, first discovered by Bichat, who applied it only to man; re-discovered by Cuvier, who applied it to the animal world in its entirety. It reacted on all other branches of human knowledge, by bestowing on the minds of men an illimitable
