Preface

THIS Portfolio of Dermochromes contains two hundred and sixty-six colored and six black and white illustrations. Of the former two hundred and seventeen appeared in the fourth edition of Jacobi's Atlas, but the remaining forty-nine are now presented for the first time. The black and white illustrations are all new. These represent different types of alopecia and were made from photographs taken for me by Dr. William B. Trimble.

Although many of the plates will be familiar to American physicians, the accompanying text is entirely new. In its preparation the writings of the leading American, British, and Continental dermatologists have been freely consulted, but preference has generally been given to the views of the former, as the work is intended chiefly for readers in this country. I particularly desire to acknowledge manifold obligations to Drs. Bulkley, Duhring, Pusey, and Stelwagon.

The section on syphilis was intrusted to Dr. William Gaynor States, and I greatly appreciate the honor of having his able presentation of this disease incorporated in this work.

To my clinical associates at the New York Skin and Cancer Hospital I am indebted for considerable assistance; to Dr. Paul E. Bechet and Dr. Arthur M. Kane for valuable aid in preparing the manuscript and in passing the work through the press, and to Dr. Binford Throne for the excellent chapters on the exanthemata. I here take pleasure in expressing to them my thanks for their generous cooperation.

The subjects have been grouped, as far as practical, according to generally accepted pathological classifications, and with but few exceptions the nomenclature recommended by the American Dermatological Association has been adhered to in the text.

While fully realizing that in a work of this scope individualism is out of place, I must confess that I have not always refrained from the temptation to interject personal impressions and opinions.

JEROME KINGSBURY.
