PREFACE.

THE subject treated of in the following pages is usually styled *Analytical Geometry*, but its real nature seems to be better expressed by the title *Co-ordinate Geometry*, since it consists entirely in the application of the Method of Co-ordinates to the Solution of Geometrical Problems.

The present Treatise, in which we shall confine our attention to figures and curves in one plane, will consist of two parts: the first part is all that is at present published; it contains the application of the method of Co-ordinates to Right Lines, Circles, and Conic Sections. In the second part, the properties of Curves in general, with reference to Tangents, Asymptotes, Singular Points, Curvature, &c., will be investigated, without assuming a knowledge of the Differential Calculus on the part of the Student. A Historical Account of the subject, and a large collection of Problems will be added.

The complete analysis given in the Table of Contents renders it unnecessary to say much here respecting the plan pursued in the Treatise. In the first chapter the meaning of the signs $=$, $+$ and $-$, and the nature of negative and imaginary quantities, are fully explained, on principles which seem to combine generality and simplicity. The difficulties

which are supposed to beset the foundations of Algebra, are partly due to the indistinctness of the definitions usually given of algebraical symbols. In the subsequent chapters, the Author has endeavoured to adhere to a uniformity of method which, he hopes, will render it easy to acquire and retain a knowledge of the subject. He has also made use of symmetrical equations as much as possible, as there can be no doubt that many advantages are lost, and none gained, by want of attention to symmetry in analytical processes. The properties of Conjugate diameters are investigated by means of the angle called the Eccentric Anomaly in Astronomy, but the same properties are deduced without making use of this angle in Chapter XI. Several geometrical illustrations are given in notes, and various Problems and Examples, many of which are taken from the Senate-House Problems and other sources are added at the end of each chapter.

CAMBRIDGE,
March, 1844.

TABLE OF CONTENTS.

CHAPTER I.

MEANING of the Signs = + -. Nature of Negative Quantities. Multiplication by a Negative Quantity. Impossible Quantities. Meaning of the Sign $-^1$. Sense in which the Signs = + - are used in the present subject.

ARTICLES

1. Meaning of the Sign =.
- 2, 3. Meaning of + and -.
4. Examples.
5. $X + Y = Y + X$.
6. Our definition of $X - Y$ does not require X to be greater than Y .
7. Definition of a Negative.
8. A positive quantity what.
- 9, 10. Of the Notation $-Y$, and $+Y$.
- 12, 13. $-(-Y) = Y$, $-(X - Y) = Y - X$.
14. To add $-Y$ is the same thing as to subtract Y , and to subtract $-Y$ the same thing as to add Y .
- 15, 16. General method of extending the meaning of a Notation to cases not contemplated in its original definition.
17. Meaning of $(-a) \cdot b$, $a \cdot (-b)$, and $(-a) \cdot (-b)$.
18. Meaning of $\left(\frac{m}{n}\right) \cdot \left(\frac{p}{q}\right)$.
- 19, 20. In what sense the Square Root of a Negative Quantity is impossible.
- 21-24. How we arrive at the meaning of the Sign $-^1$. It may be called the Seminegative Sign.
25. Example of a Seminegative Quantity.
26. The square root of $-Y^2$ is the Seminegative of Y .
27. Meaning of the Signs = + in Co-ordinate Geometry.
- 28-30. Meaning of $-$, of Negative, and of Positive Quantities.

CHAPTER II.

Nature of Co-ordinate Geometry. Representation of Points by means of Co-ordinates. Propositions respecting the Co-ordinates of Points. Representation of Curves by means of Equations between x and y .

ARTICLE

- 33. The Co-ordinates of a Point : what.
- 34. Origin of the name Co-ordinate.
- 35-37. Axes of x and y . Origin of Co-ordinates. Examples.
- 38. Relations between the Co-ordinates of two Points, the Line joining them, and the Angle that Line makes with OX .
- 39. Angle which one Line makes with another, what : distinction between the distances $P'P'$ and PP .
- 40-42. Areas of certain figures found.
- 43-46. Method of representing Lines and Curves by means of Equations between x and y . Loci.
- 47-49. Definition of the Locus represented by any Equation between x and y . Examples.

CHAPTER III.

General Equation of the Right Line. Equations of Lines subject to various conditions. Miscellaneous Propositions. Problems.

ARTICLE

- 50. The general Equation of the first degree represents a Right Line.
- 51. Expression for the Angle which a Line makes with OX .
- 52. Converse of Art. 50.
- 53. The portions which a Line cuts off from the Axes found.
- 54, 55. Method of constructing a Line from its Equation.
- 55, 57. Of certain forms in which the Equation of the Right Line may be put.
- 58, 59. Current Co-ordinates and Parameters, what. Current Co-ordinates belonging to different Lines are not distinguished from each other.
- 60, 61. Equation of a Line passing through one or two given Points.
- 62, 63. Conditions necessary in order that two Lines may be parallel or perpendicular to each other.
- 64, 65. Point of intersection of two Lines.
- 66. Angle contained between two Lines.
- 67. Equation of a Line making a given Angle with a given Line.
- 68. Distance of a Point from a Line in a given direction.
- 69, 70. Perpendicular distance of a Point from a Line.
- 71. Equation of a Line passing through the intersection of two given Lines.
- 72-84. Various Problems respecting Right Lines.

CHAPTER IV.

Oblique Co-ordinates. Modifications necessary in the previous results when the Co-ordinates are supposed to be Oblique. Polar Co-ordinates. Transformation of Co-ordinates.

ARTICLE

85. Oblique and Rectangular Co-ordinates.
 86. Articles which require no alteration when the Co-ordinates are supposed to be Oblique.
 87. Alterations necessary in Article 88.
 88, 89. Ditto in Article 50 and 51.
 90, 91. Ditto in Article 62.
 92. Ditto in Article 66.
 93. Ditto in Articles 68, 69.
 94. Polar Co-ordinates, what. Radius Vector. Vectorial Angle.
 95, 96. Negative values of r , how drawn. Examples.
 97. Polar expression for the distance between two Points.
 98, 99. Polar Equation of a Right Line.
 100. Transformation of Co-ordinates.
 101. Transformation of Polar Co-ordinates into Rectangular, or *vice versa*.
 102-104. To turn Rectangular Axes round the Origin through any Angle.
 105-107. To transfer the Origin to any Point.
 108. To reverse the positive direction of either Axis.
 110. To turn Oblique Co-ordinates in any manner round the Origin.
 112. To transfer the Pole and turn the Prime Radius through any Angle.
 113-117. Various Problems respecting Lines referred to Oblique Co-ordinates.

CHAPTER V.

General Equation of the Circle. Diameters, Tangents, and Normals of a Circle. Various Problems respecting Circles and Right Lines.

ARTICLE

- 118-121. General Equation of the Circle.
 122, 123. To construct a Circle from its Equation. Examples.
 124, 125. Circle referred to Oblique Co-ordinates.
 126, 127. Circle referred to Polar Co-ordinates.
 128. Distance of a given Point from a Circle in a given direction determined by a Quadratic Equation.
 129, 130. Sum and product of the Roots of the Equation.
 131, 132. Distance of the middle Point of the Chord from the given Point. Condition necessary in order that the Point (xy) may be the middle Point of the Chord inclined at an Angle θ to OX .
